

# March is Greenhouse MADNESS!

Go on offense to defeat common bedding plant diseases:  
**4 Key Plays to Score Healthy Bedding Plants**

## 1. Be relentless with sanitation:

Insist on relentless sanitation habits and minimize plant stress.

## 2. Carefully hydrate, give space and air:

Water plants early, minimize overhead irrigation and splashing; provide good air circulation and adequate plant spacing.

## 3. Scout continuously for disease:

Continuously scout for diseased/dying plant tissue; discard in a sealed bag away from the greenhouse. Sanitize tools!

## 4. Prevention is the best cure:

Use quality, preventive fungicide treatments strategically:

**To prevent damping-off and root rots.** After sowing seeds/transplanting: first drench with a high-quality fungicide like X3® followed 3 days later with a drench of Phyton 27® or Phyton 35® to protect crops for up to 21 days.

**When conditions are favorable for Botrytis.** Phyton 27 and Phyton 35 can be applied to open blooms with a low risk of phytotoxicity when used as directed.

**When conditions are favorable for powdery mildew, fungal leaf spots, and bacterial diseases.** Phyton 27 and Phyton 35 can be used preventively or curatively and are known in the industry for providing outstanding protection against bacterial diseases.
